#### Facility Preparation for MicroShield 360 Application

Congratulations! You're about to be protected by the most technologically advanced preventative coating on the market.

It's important to remember that MicroShield 360 is an antimicrobial coating system. "Coating" being the key word. Meaning whatever surface is physically sprayed will have the solution bonded to it. Therefore, if there is dust, dirt, grime or other debris on the surface during application those will be coated. Once they are eventually removed, that space on the substrate will then be left un-treated.

#### What's going to be sprayed?

MicroShield 360 is a preventative measure that is intended to reduce cross-contamination between individuals within a facility. Therefore, the objective is to apply to all items within your facility that may be touched by more than 1 individual in any given day. The list of items to be treated will vary depending on facility type and should be provided to you by your MicroShield 360 sales rep.

#### How Do I Prepare?

1. Remove all items from flat surfaces that are to be treated. They can be placed directly on the floor in front of it but not in a manner that would cover handles. Focus on counters, desks and tables
2. If carpets are being treated please vacuum all carpets prior to our arrival
3. Please ensure all internal doors are unlocked
4. Properly dust all hard surfaces followed by a hand wiping with a cleaning agent / disinfectant
5. Clean all mold, fungus and mildew from shower tiles and grout
6. Ensure all surfaces are dry

Remember, the cleaner the better. If you can visually see a surface is dirty, then we cannot apply to it. If you need a third party to clean your facility prior to MicroShield 360 application, please contact MicroShield 360 for a list of janitorial service providers in your area.

We look forward to protecting your facility!
